

**[Optimal Networks for Train
Integration Management across Europe]**

Collaborative Project
7th Framework Programme

Dissemination ON-TIME project results for Sweden,
2014-09-25.

Mr Magnus Wahlborg, Trafikverket
Dr Mrs Meena Dasigi, NetworkRail

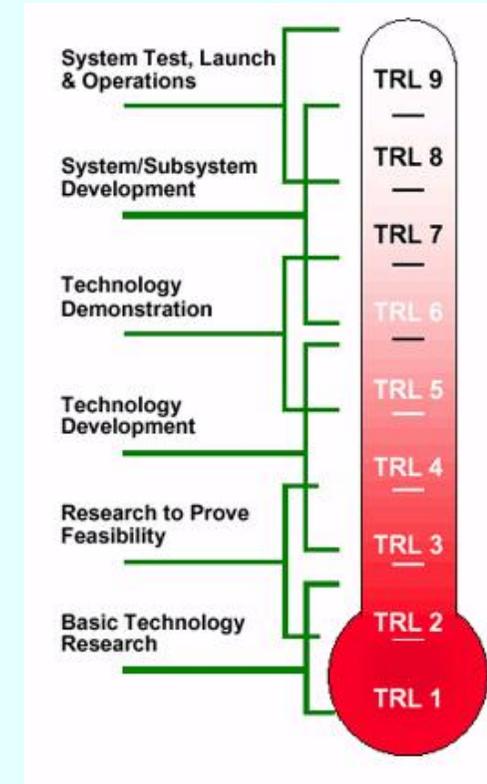

ONTIME Overview

Agenda

- ON-TIME Overview (9.30)
- Timetable planning
- Operations minor perturbations – decision support traffic control
- Decision support train drivers
- Lunch (12.30 – 13.30)
- Implementation into practice
- Operations handling major perturbations
- Demonstration and simulators
- EU research (16.50)

Purpose

- Dissemination of project results ⇔ Swedish research (KAJT) ⇔ Implementation into practice
- State-of-the-art
- Processes
 - Improve work Trafikverket
 - Improve work in Sweden Railways
- Improve methods and knowledge
- Innovations and products

Technical Work Packages

WP1 - User and technical requirement elicitation and validation
(Network Rail)

WP2 - Examination of existing approaches and specification of
innovations (Trafikverket)

WP3 - Development of robust and resilient timetables (Delft)

WP4 - Methods for real-time traffic management (Dresden)

WP5 - Operation management of large scale disruptions
(IFFSTAR)

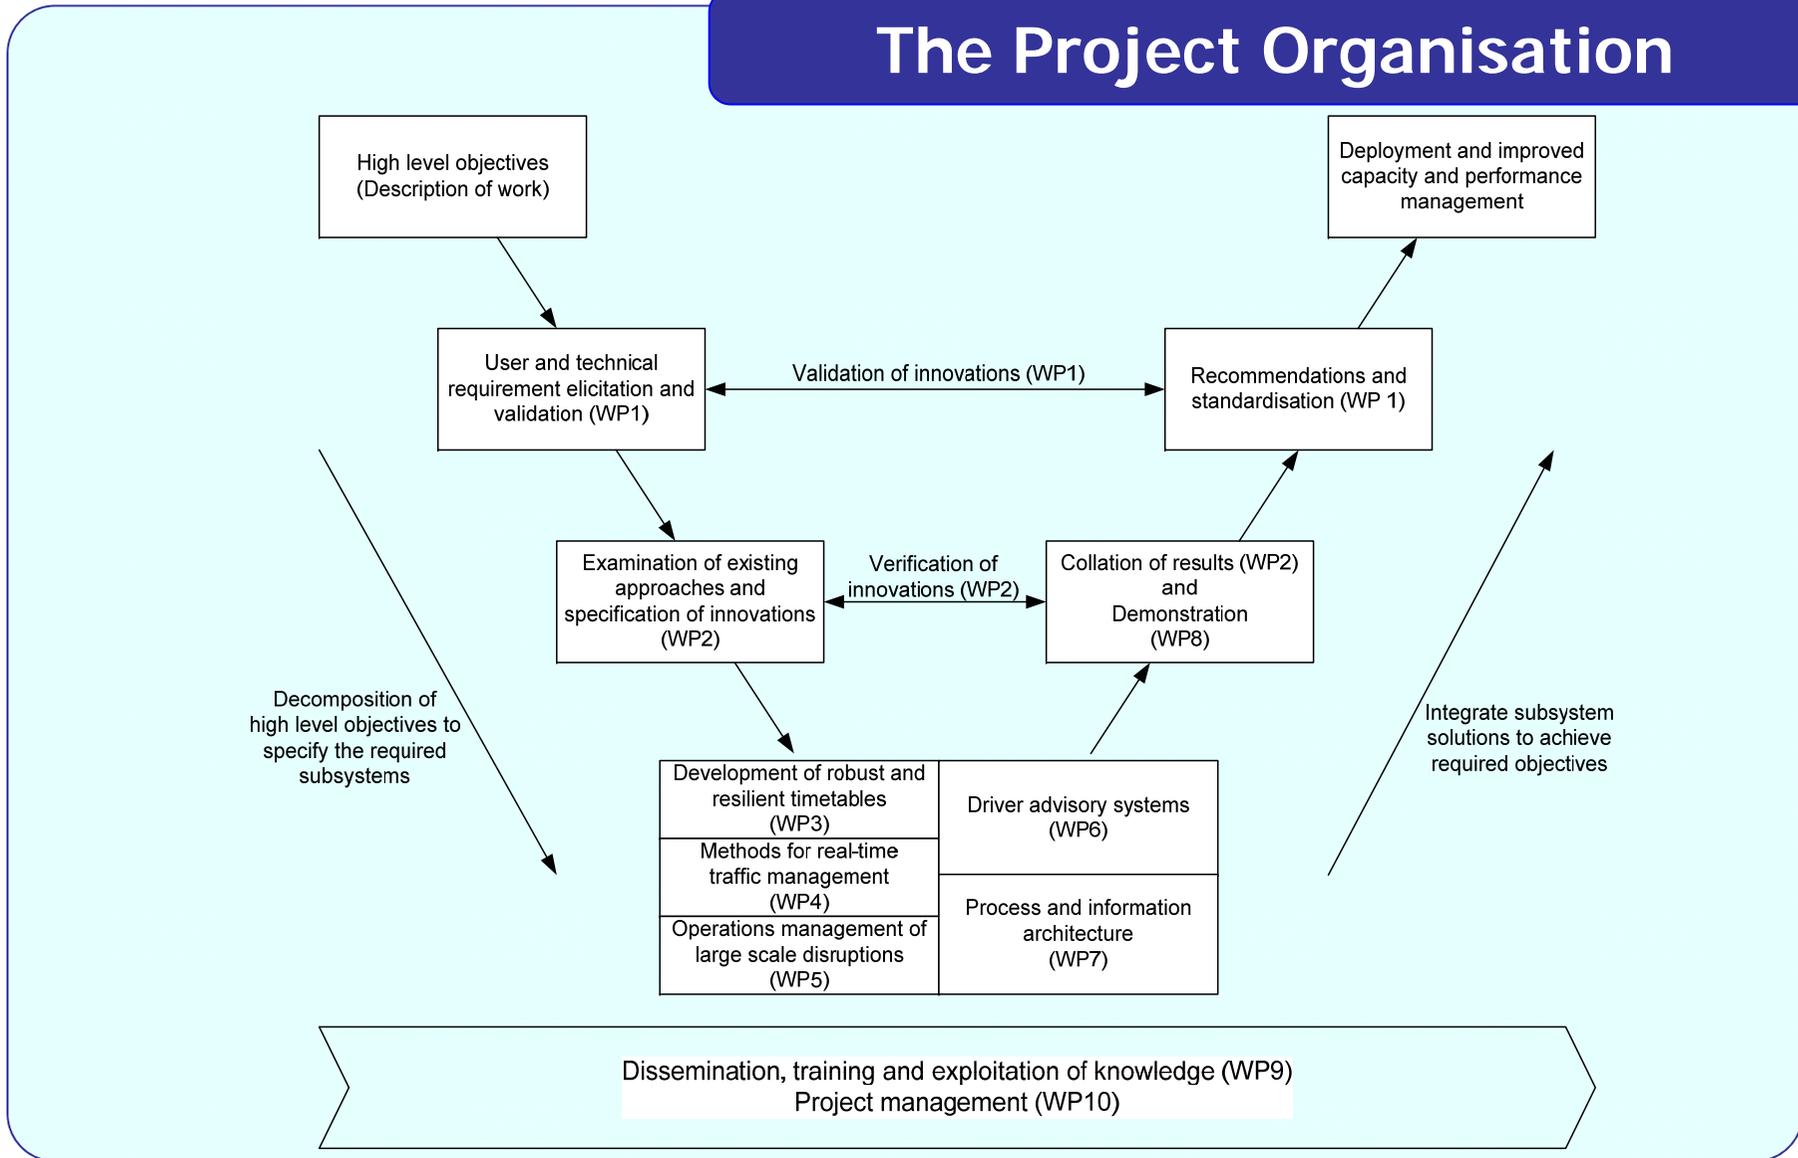

WP6 - Driver advisory systems (DB)

WP7 - Process and information architecture (NTT Data)

WP8 – Demonstration (Ansaldo)

WP9 – Dissemination (Birmingham)

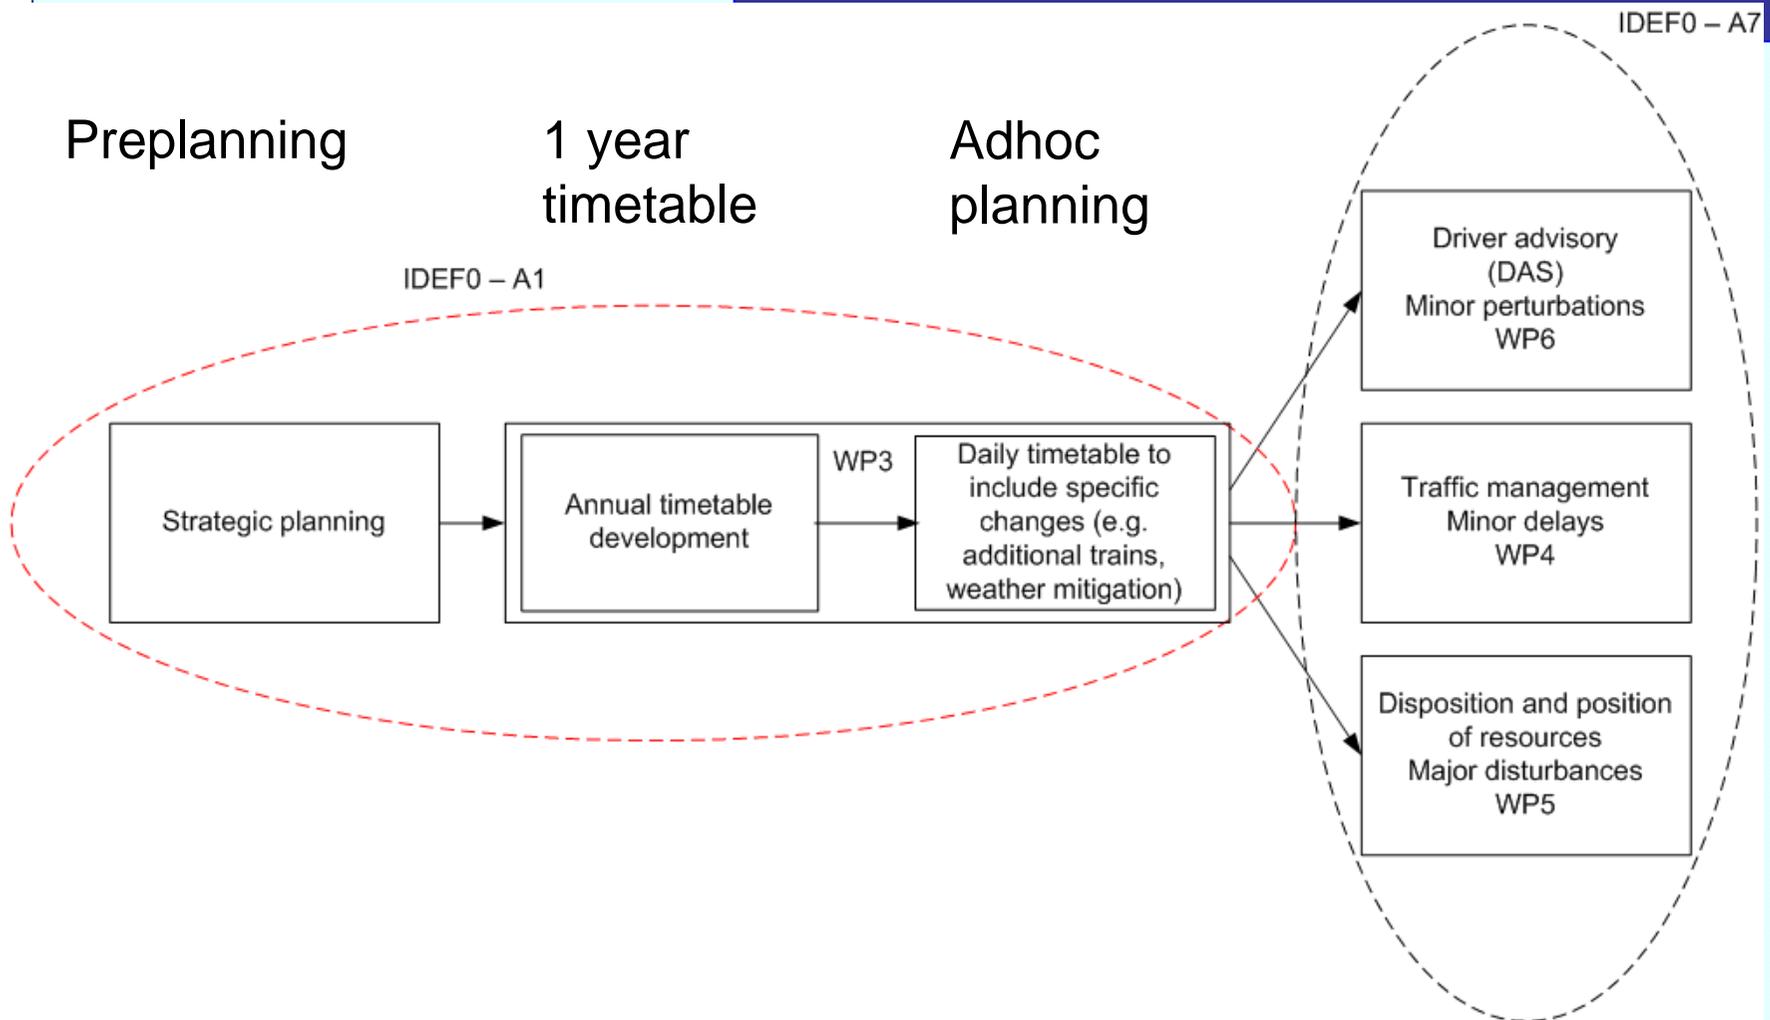

The Project Organisation

Project Overview

- The high level aim is to improve ‘capacity’ on European railway networks
- Project team has developed six innovations:
 1. Standardised definitions, methods and processes to create interoperable processes
 2. Improved methods for timetable construction
 3. Real time traffic algorithms
 4. Improved decision support – handling major perturbations
 5. Centrally guided train operation
 6. Standardised ICT architecture supporting interoperable operational data between industry stakeholder

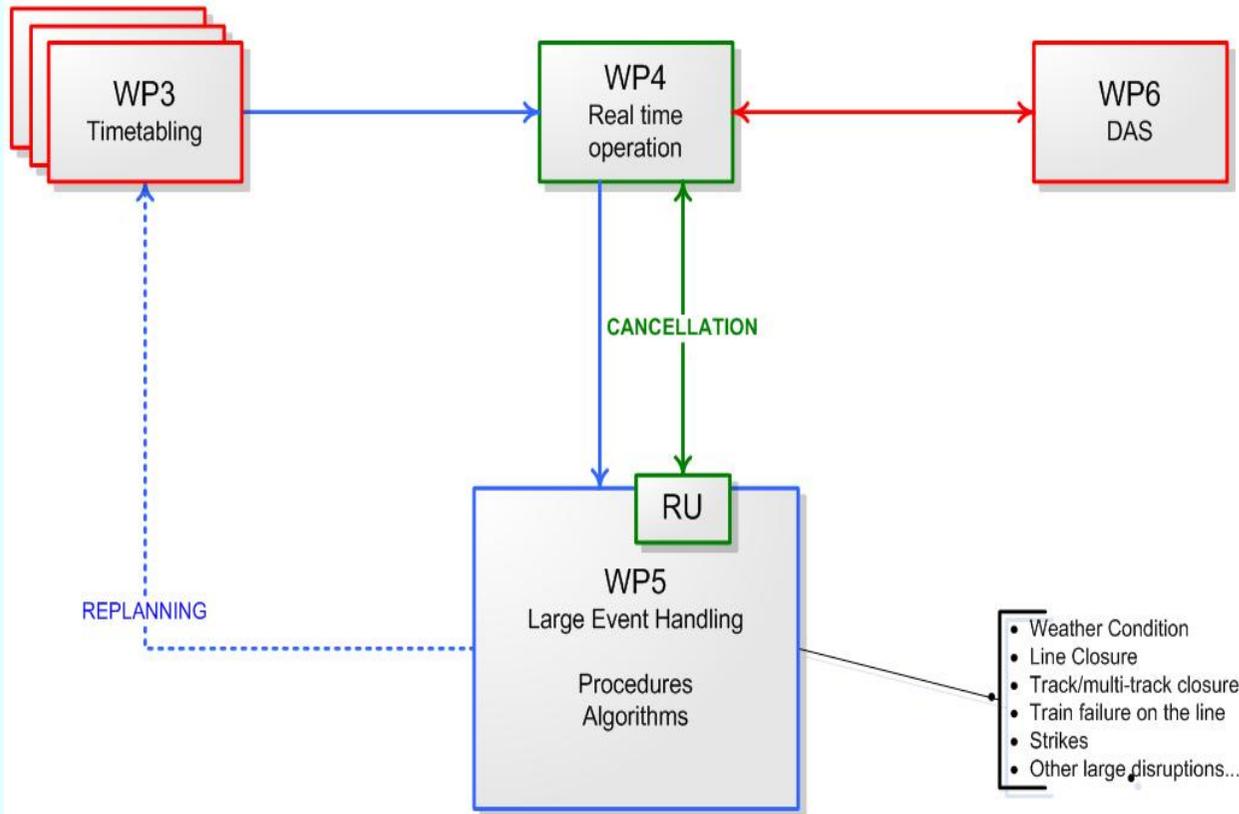

Planning – Operational process

Smaller perturbations – large disturbances

ON-TIME Work package interactions

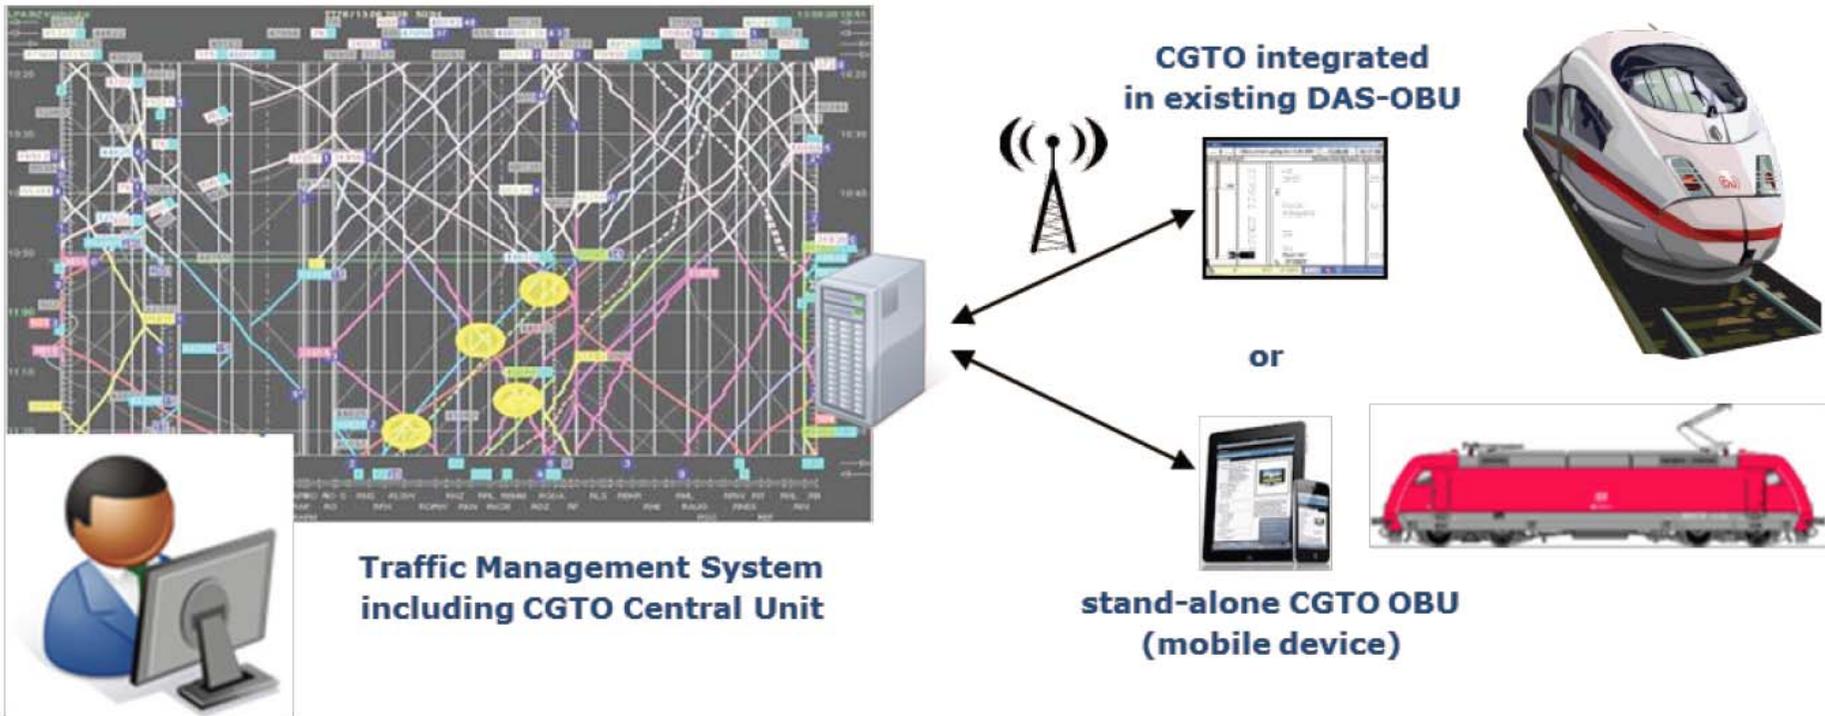

WP3, WP4, WP5 & WP6

Processes and TRL

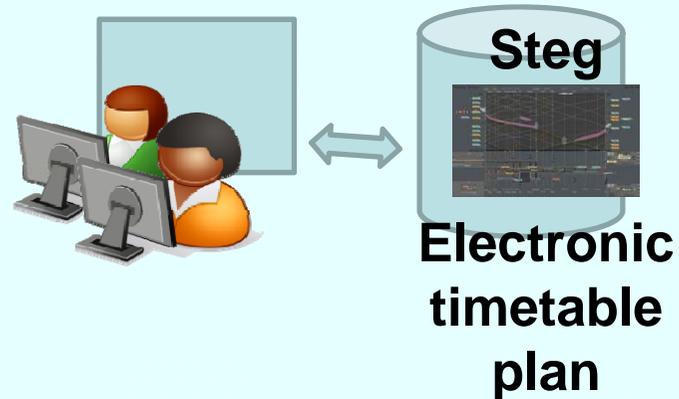

1. Functional process description 6 countries
Sweden, United Kingdom, Germany, Italy,
Netherlands and France
2. State-of-the art WP 3 – wp 6, 6 innovations
 1. Timetable planning TRL3
 2. Traffic control minor perturbations TRL 3
 3. Operational management larger disturbances TRL 3
 4. Driving advisory systems TRL 5

Centrally Guided Train Operation (CGTO)

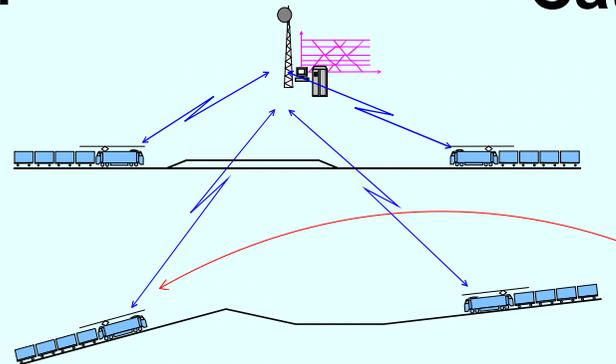

Uppsala University

- Research in traffic control 1995 – 2010
- Steg concept

Iron Ore line

- Steg, Controlcenter Boden
- Transrail
 - Cato system
 - Das

Cato

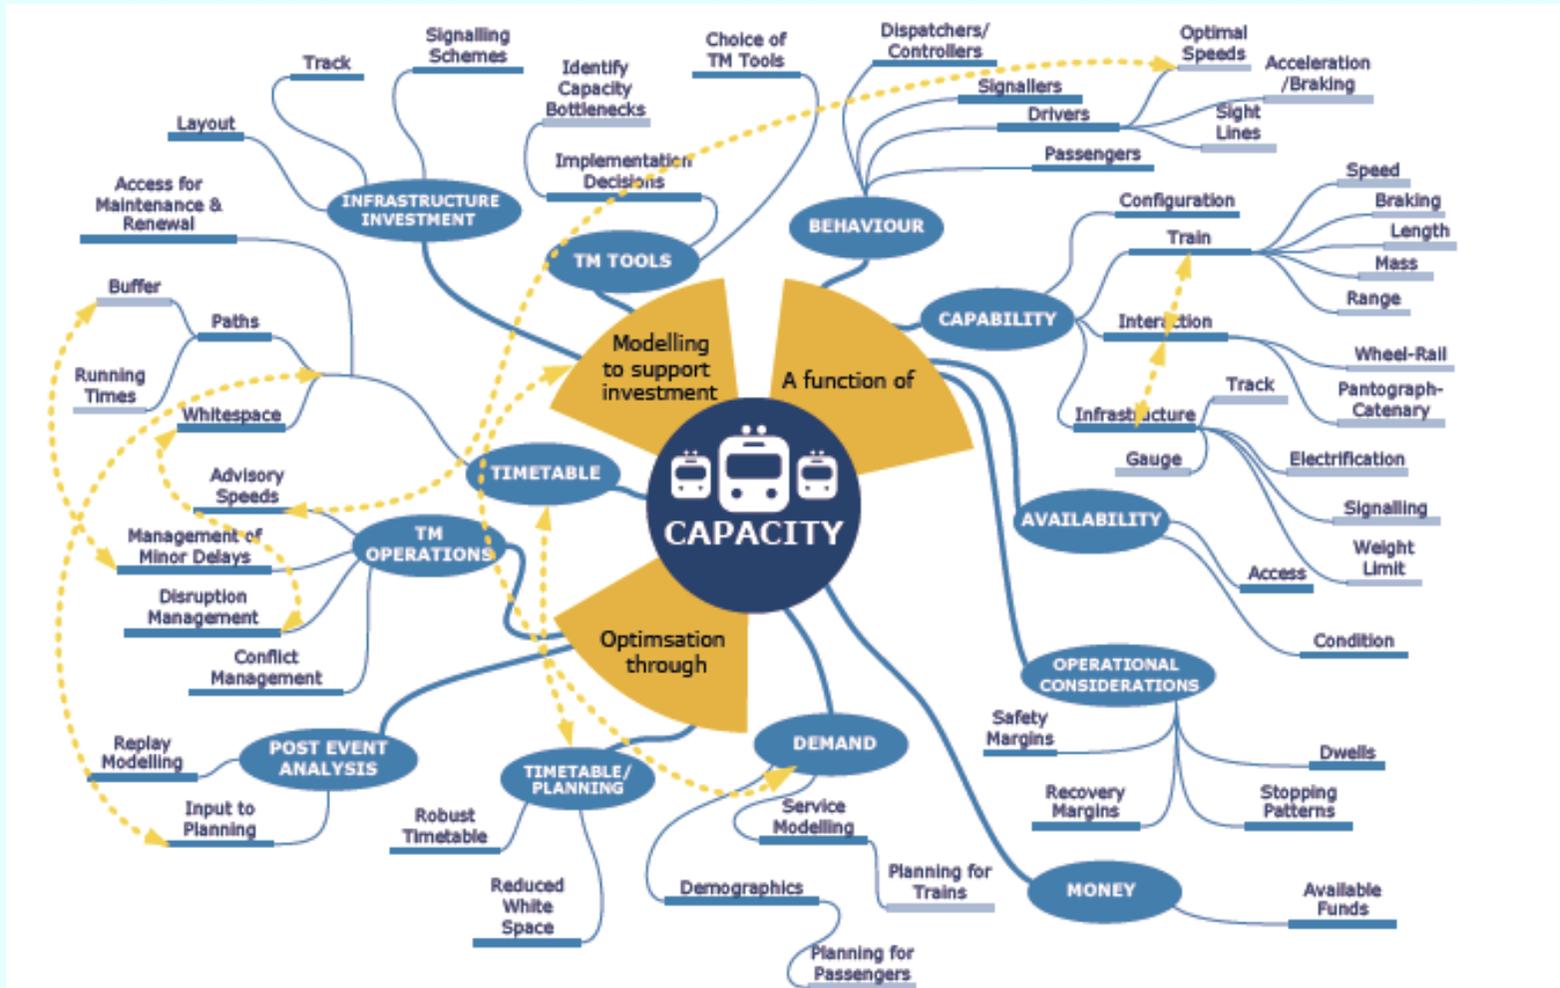

High Level Aims and Objectives

The aim of the project is to achieve a step-change in railway capacity by reducing delays and improving traffic fluidity. This has been achieved through a partnership between railway industry experts, system integrators, small dynamic knowledge led companies and academic researchers.

The project will draw on previous research projects and national trials. Previous relevant academic research has, in general, been based on algorithm development. To apply the results of such research needs an understanding of the practical operating principles and the nature of delay initiation and propagation.

The Challenge!

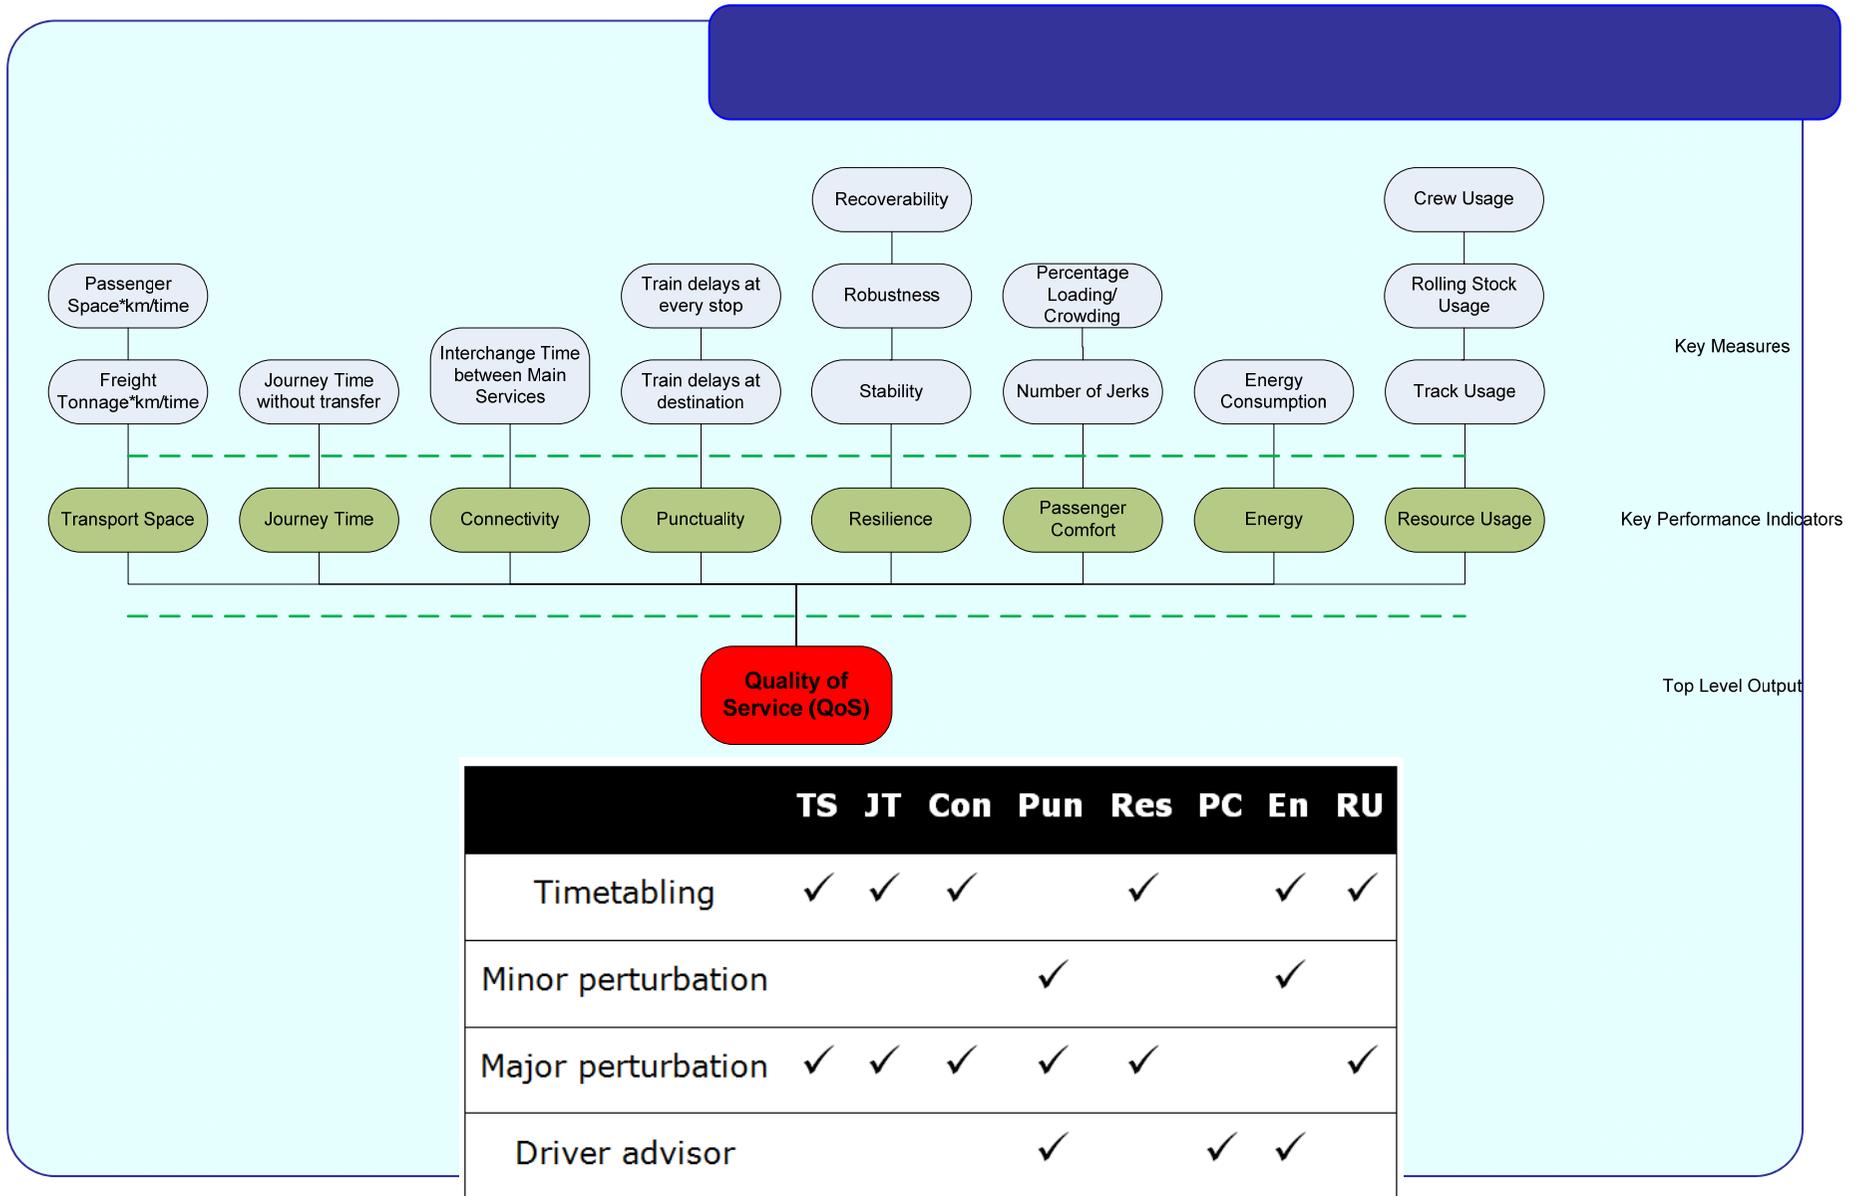

Project Overview

Project team has developed six innovations:

1. **Standardised definitions, methods and processes to create interoperable processes**
2. Improved methods for timetable construction
3. Real time traffic algorithms
4. Improved decision support – handling major perturbations
5. Centrally guided train operation
6. Standardised ICT architecture supporting interoperable operational data between industry stakeholder

.... and four demonstrations

Project Overview

Project team has developed six innovations:

1. Standardised definitions, methods and processes to create interoperable processes
2. **Improved methods for timetable construction**
3. Real time traffic algorithms
4. Improved decision support – handling major perturbations
5. Centrally guided train operation
6. Standardised ICT architecture supporting interoperable operational data between industry stakeholder

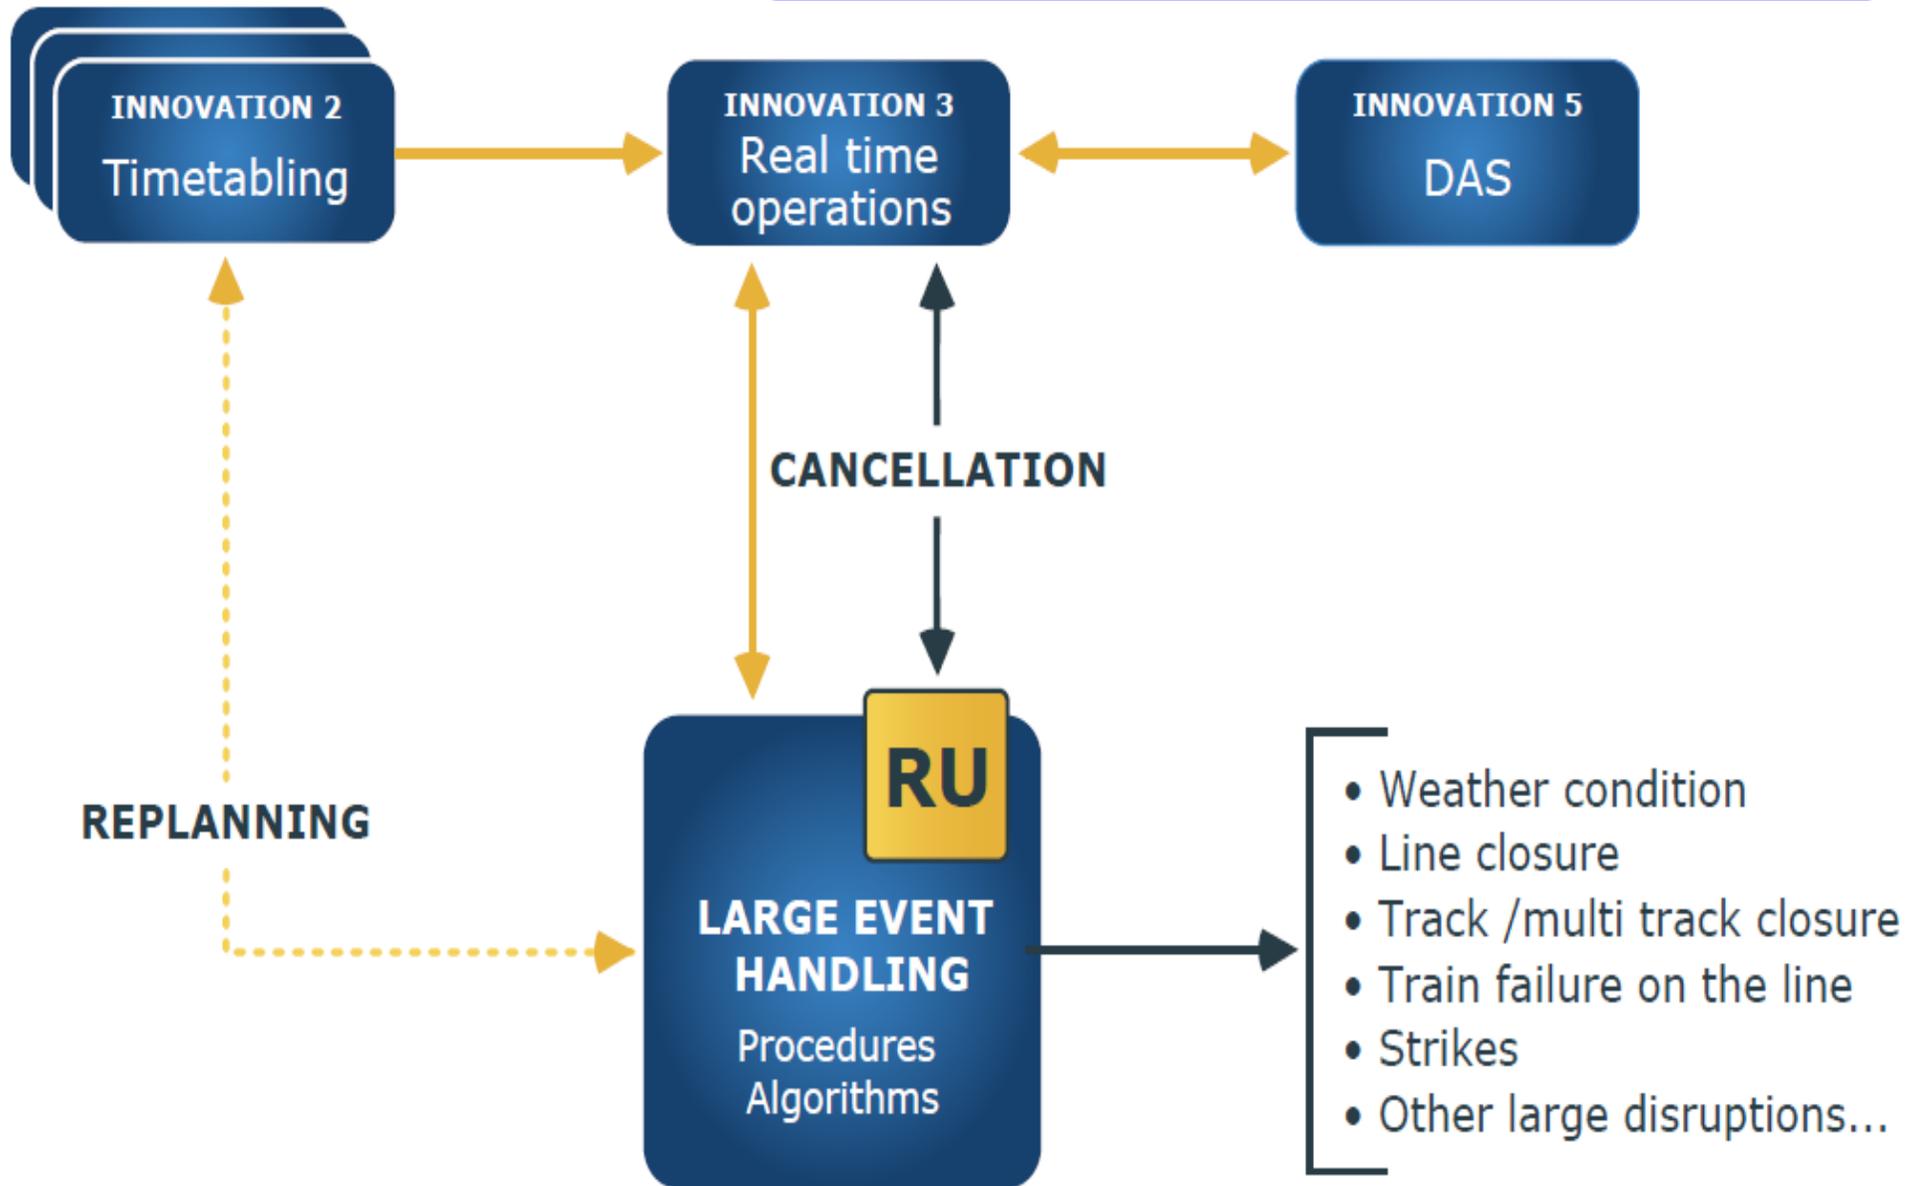

.... and four demonstrations

Project Overview

Project team has developed six innovations:

1. Standardised definitions, methods and processes to create interoperable processes
2. **Improved methods for timetable construction**
3. **Real time traffic algorithms**
4. Improved decision support – handling major perturbations
5. **Centrally guided train operation**
6. Standardised ICT architecture supporting interoperable operational data between industry stakeholder

.... and four demonstrations

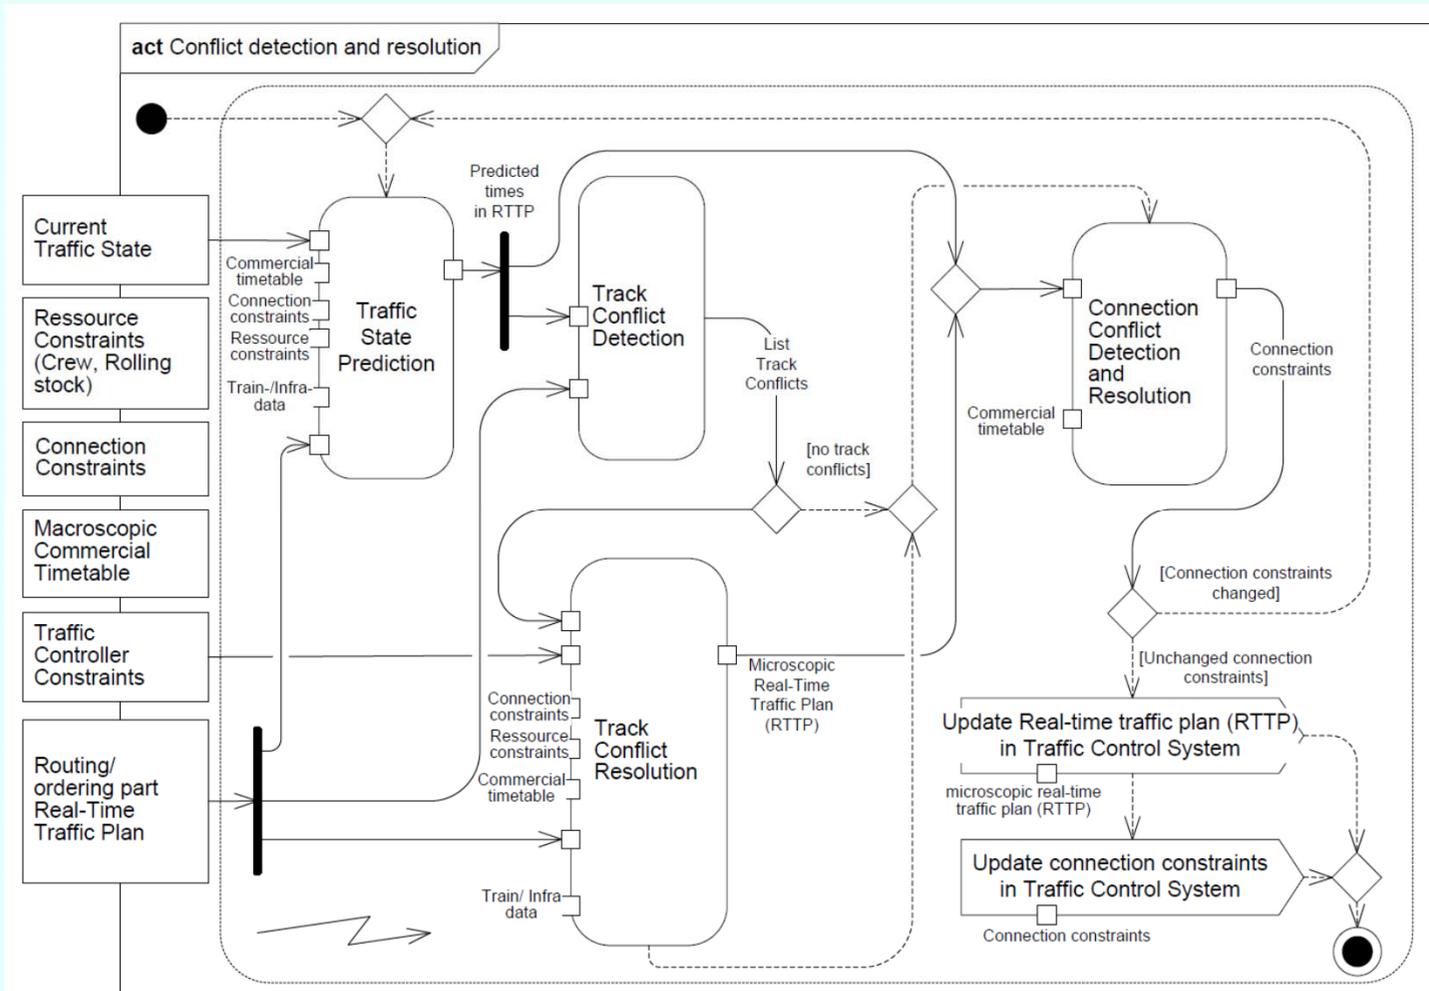

Project Overview

Project team has developed six innovations:

1. Standardised definitions, methods and processes to create interoperable processes
2. Improved methods for timetable construction
3. Real time traffic algorithms
4. **Improved decision support – handling major perturbations**
5. Centrally guided train operation
6. Standardised ICT architecture supporting interoperable operational data between industry stakeholder

.... and four demonstrations

Handling Major Perturbations

Project Overview

Project team has developed six innovations:

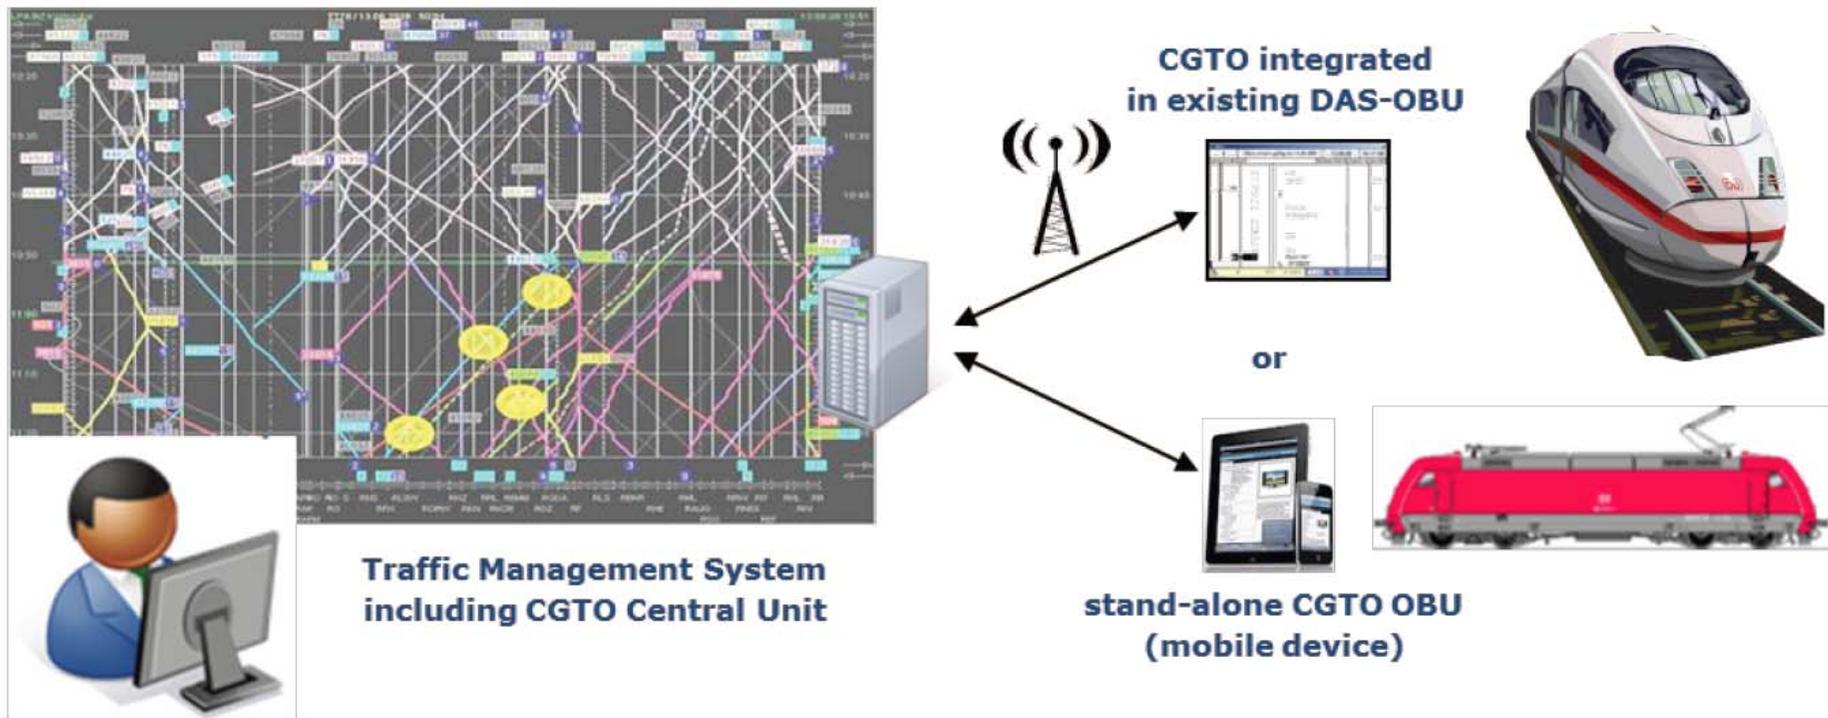

1. Standardised definitions, methods and processes to create interoperable processes
2. Improved methods for timetable construction
3. Real time traffic algorithms
4. Improved decision support – handling major perturbations
5. **Centrally guided train operation**
6. Standardised ICT architecture supporting interoperable operational data between industry stakeholder

.... and four demonstrations

DAS Architecture alternatives

Alternative	DAS-C	DAS-I	DAS-O
Trajectory computation	Centrally	Centrally	Centrally
Advice generation	Centrally	On-board	On-board
Communication availability	Highest	Medium	Lowest
Messages	Small and frequent	Medium size and number	Large but few

Centrally Guided Train Operation (CGTO)

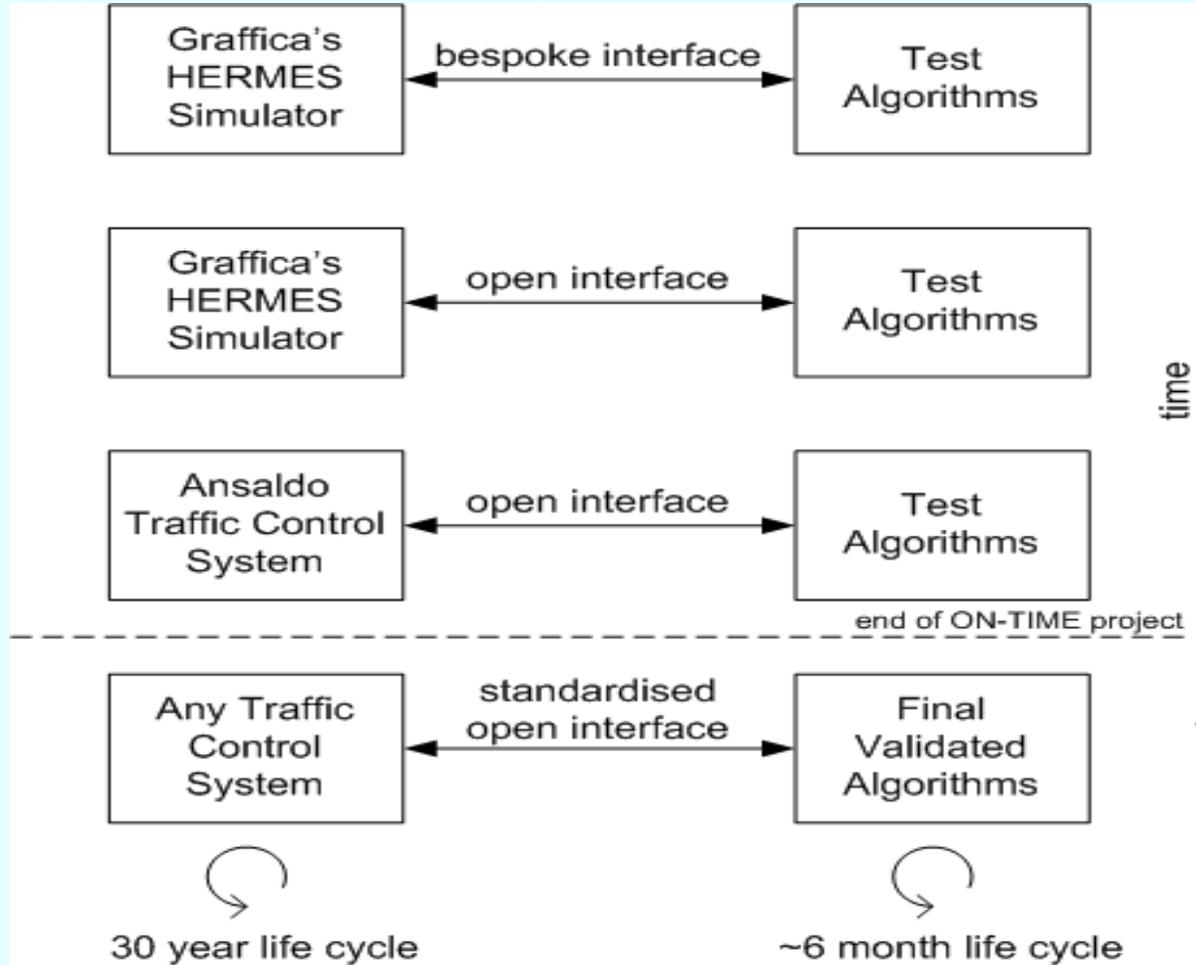

Project Overview

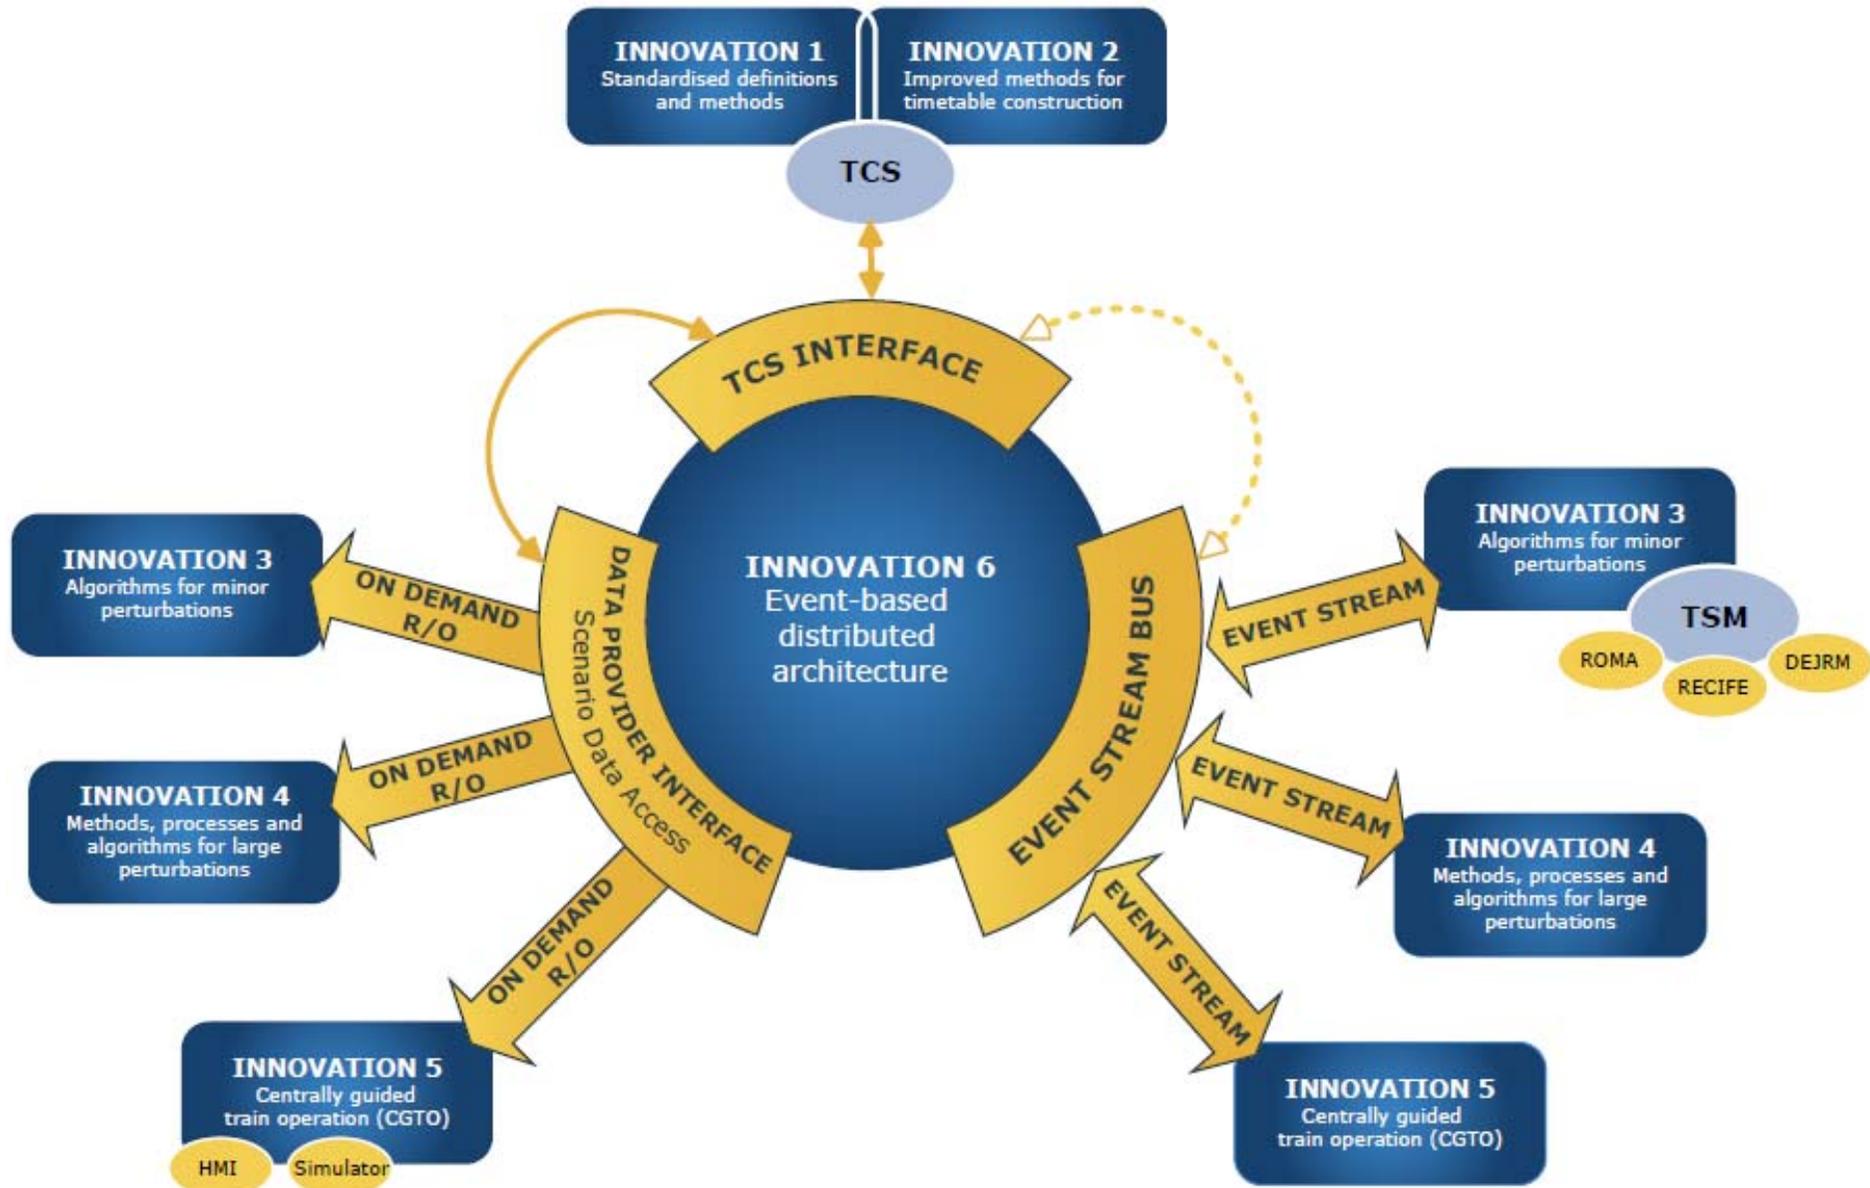

Project team has developed six innovations:

1. Standardised definitions, methods and processes to create interoperable processes
2. Improved methods for timetable construction
3. Real time traffic algorithms
4. Improved decision support – handling major perturbations
5. Centrally guided train operation
6. **Standardised ICT architecture supporting interoperable operational data between industry stakeholder**

.... and four demonstrations

Standardised ICT architecture

Project Overview

Project team has developed six innovations:

1. Standardised definitions, methods and processes to create interoperable processes
2. Improved methods for timetable construction
3. Real time traffic algorithms
4. Improved decision support – handling major perturbations
5. Centrally guided train operation
6. Standardised ICT architecture supporting interoperable operational data between industry stakeholder

.... **and four demonstrations**

Utrecht Demonstration

Conclusions

- The ON-TIME project has made the first steps integrating Traffic Control System, Conflict Detection Resolution and Driver Advisory Systems
- Standardised interfaces will lead to broader application of new technology
- Demonstrators in four countries have shown the potential of the developed technology
- Information is available on the website of the project
www.ontime-project.eu
